

Description

This workshop will help you start working with Embedded Linux and the F&S products easier. It consists of three parts. First, you get an introduction you to the operating system Embedded Linux. In the second part you will learn how to start F&S platforms and how to configure them. At the end of the workshop we are going to show you how to program software for our RISC-based product families, how to run the software and how to test and debug it.
